The L-amino acids produced are used in animal nutrition, human medicine, foodstuffs industry and the pharmaceuticals industry. The present sequence is Corynebacterium glutamicum strain ASO19 glucose 6-phosphate isomerase (pgi) DNA.

                                                                                                                                                                                                                                                                                                                           The present sequence encodes a coryneform bacterial glucose-6-phosphate isomerase (gpi). After attenuation of the gpi gene, coryneform bacteria exhibit an improved metabolic flux through the pentose phosphate cycle and produce nucleotides, vitamins, and in particular L-amino acids, particularly L-lysine and L-tryptophan, in an improved manner. Attenuation may be achieved by reducing or switching off either the expression of the gpi gene or the catalytic properties of the enzyme protein. Microorganisms, in particular Corynebacterium glutamicum in which the gpi gene is attenuated or switched off, optionally in combination with amplification of further genes, are useful for accombination with amplification of further genes, are useful for

                                                          The present invention describes a library of human polynucleotides comprising the sequences given in AZZ1252 to AZZ17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one cdifferentially expressed gene product in a test sample from a cell cancerous. State of a mammalian cell, comprising detecting at least one cdifferentially expressed gene product in a test sample from a cell content of being cancerous, where the gene product is encoded by one cf the 5248 polynucleotide sequences given in AZZ1253 to AZZ1779. The collection of polynucleotides source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, can be used for polynucleotides source of primers and probes, which can cc mapping, tissue typing or profiling, forensics, genetic analysis and contection of polynuclposisms. Polypoptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and content of purposes. The polynucleotides may also be used to construct carrays for diagnostics (which may be used to determine function of an cells (e.g. to identify abnormal or diseased tissue in a human, to cidentify a genetic predisposition or susceptibility to a disease such as concer). The polynucleotides of the invention are especially used in the cdiagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for conceptible analogues and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-APR-1998;

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary ct to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the CC polynucleotide which comprises a 3'-end sequence, where the CC polynucleotide comprises at least 15 nucleotides and the combination of CC the 5'-end sequence, and sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primer sets can be used in antisense therapy and CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC detection and/or diagnosis of the abnormality of the proteins encoded by CC detection and/or diagnosis of the primers are also useful for AAH13628 and AAH13633 to AAH18742 represent human cDNAs sequences; AAB92446 to AAH3633 to AAH3642 represent human cond sequences; AAB92446 to AAH3633 co fine present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 3; SEQ ID 5660; 2537pp + CD ROM; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length CDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oilgo-OF primer and an oilgonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oilgonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oilgonucleotide comprises a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end comprises a 5'-end sequence and an oilgonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oilgonucleotide which comprises a 3'-end sequence, where the CC oilgonucleotide comprises a 3'-end sequence, where the CC oilgonucleotide comprises at least 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the AAH13628 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29-JUL-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
         AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                              Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis o disorders such as prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immonmodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; ygyaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease; ss.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are medical conditions e.g. by protein or gene therapy. The genes are consisted from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) Lumune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's chiese, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and cepilepsy; and (f) infectious diseases such as viral, bacterial, fungal cand parasitic infections, but was obtained in electronic format directly crom WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                   The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, and prevention of: (a) cancer, e.g. breast and ovarian cancer and cother cancers of the adrenal gland, bone, bone marrow, breast gastrointestinal tract, liver, lung, or urogenital; (b) immune discretes e.g. Addison's disease, allerqies autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; parasitic infections diseases such as viral, bacterial, fungal and parasitic infections, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-NOV-2000

                                                                                                                           QΥ
                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                 The invention relates to isolated nucleic acid molecules and their concoded secreted proteins. The nucleic acids and proteins are used to CP prevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They care also used in diagnosing a pathological condition or susceptibility comes and so the proteins can also be used in alleviating symptoms associated with the disorders and in clud autoimmune diseases e.g. radioimmunoassays or enzyme linked conclude autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. rheumatoid arthritis, can also cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection, and many other consorted in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to preserve takin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to cregenerate tissues and in chemotaxis. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to regenerate tissues and in chemotaxis. The polypertides can also be used to aid middlive or preservative to increase of primary tissues, to cregenerate tissues and in chemotaxis. The polypertides can also be used cas a food additive or preservative to increase ot are also be used cas a food additive or preservative to increase ot are also be used cas a food additive or preservative to increase ot are also be used cas a food additive or preservative to increase ot are also be used cas a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, and carbohydrate and protein of the preservation of the pr

                                                                                                                                                                                                                                                                                      δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel human colon associated polypeptides (AAU22761), and the cDNA and genomic sequences encoding for them. The sequences of the hyention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders of the colon including colon cancer, congenital abnormalities (e.g. atresia and stenosis), bacterial and viral infections, inflammatory bowel disease (IBD), neoplastic cell disorders (e.g. polyps and adenomas, intestinal inflammatory disorders, colitis, colonic inflammation, diarrhoea and dysentery, malabsorption syndromes (e.g. lactose incolerance), intestinal obstruction and signoid diseases. The polypucleotides sequences of the invention can also be used in gene novel human colon associated polypeptides of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fift, whipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                          Matches

The present invention relates to the isolation of novel human colon cc associated polypeptides (AAU22768-AAU22701), and the cDNA and genomic cc sequences encoding for them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders (cc of the colon including colon cancer, congenital abnormalities (e.g. atresia and stenosis), bacterial and viral infections.

CC (e.g. atresia and stenosis), bacterial and viral infections.

CC (e.g. polyps and adenomas, intestinal inflammatory disorders, colitis, (cc lonic inflammation, diarrhoea and dysentery, malabsorption syndromes.

CC (e.g. polyps and adenomas, intestinal bastruction and sigmoid diseases.

CC (e.g. lactose intolerance), intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance), intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. lactose intolerance) intestinal obstruction and sigmoid diseases.

CC (e.g. polypucleotides sequences of the invention.

CC (e.g. polypucleotides sequences of the invention.

CC (e.g. polypucleotides data for this patent did not form part of the printed convertion of the printed convertion of the printed convertion.

CC (e.g. polypucleotides data for this patent did not form part of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of the printed convertion of th

```

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a genomic DNA fragment encoding a digestive system antigen of the invention. Disclosure; SEQ ID NO 3834; 986pp; English. Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases -Sequence 5003 BP; 1809 A; 870 C; 1047 G; 1277 T; 0 other;

GENERAL INFORMATION:

```
GENERAL INFORMATION:
APPLICANT:
APPLICANT:
TITLE OF INVENTION: TO HUMAN NEUTRALIZING MONOCLONAL ANTIBODIES
TITLE OF INVENTION: TO HUMAN IMMUNODEFICIENCY VIRUS
NUMBER OF SEQUENCES: 170
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN PC-DOS/MS-DOS
SOFTWARE: PATENTIN DATA:
APPLICATION NUMBER: PCT/US95/08743
FILING DATE: 11-JUL-1995
PRIOR APPLICATION NUMBER: US 08/276,852
FILING DATE: 18-JUL-1994
INFORMATION FOR SEQ ID NO: 156:
SEQUENCE CHARACTERISTICS:
LENGTH: 13254 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: Circular
MOLECULE TYPE: DNA (genomic)

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                   Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   contributed to prepare mouse tissues. Ist strand CDNA was primed with a primer [5'
GAGAGAGAGAGAGAGCTCTTTTTTTTTTTTTVN 3'], CDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. CDNA went through one round of subtraction to Rot = 100.0 Second strand cDNA was prepared with the primer adapter of sequence [5'
GAGAGAGATTCGGGGTTAATTPAATTCGCCCCCCCCC 3']. cDNA was cloned into the XhoI and BamHI sites. Vector: a modified pBluescript KS(+) after bulk excision from Lambda FLC I. Cloning sites, 5' end: SalI; 3' end: BamHI."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Buchaton and Genevieve Payan. It has been constructed in the vector

The sequence contained an ollop-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NotI site
and the oligo-dT track served to verify it as a clone from the
normalized embryo at 13 dpc library cDNA Library Preparation: M.B
soares lab clone distribution: cmlones will be available through
Research Genetics (www.resgen.com) The following repetitive
elements were found in this cDNA sequence: 1-85, >(GAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contact: Soares, MB

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Oscogawa and Aaron Mammoser in Pleter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CNS009WF GSS 03-JUN-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to verify it as a clone from the normalized embryo at 13 dpc library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 1-85, >(GAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Norway rat.

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pleter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic Strain y2; cn bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be trainstrain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, lenguages associated gene the present sequence is a small cell lung cancer associated gene designated as NY-SCIC-9, encoding human SOX3 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with

The invention relates to isolated polynucleotide (I) and C polymeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The C polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II), (II) is useful in gene therapy techniques CC (II), (II) is useful for generating annibodies against it, detecting or CC (III, (II) is useful for generating annibodies against it, detecting or CC (III, (II) is useful in medical imaging of sites expressing (II), (I) and (II) are useful in medical CC imaging of sites expressing (II), (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. C The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC andno acid sequences. Ass64197-AAS94564 represent novel human CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activites, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activinyinhibin activity and may be useful in the diagnosis and/or treatment of cancer levicents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or activity.
                                                                                                                                                                                                                                                                                                                                    Sequence 379 BP; 99 A; 97 C; 81 G; 102 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

CC trespiration describes antisense oligonucleotides (AAX52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and con-coding regions of RNAs corresponding to target genes, gene (initiation codons, genomic flanking regions, intron exon borders, the color from the 3'-end and the juxta section between coding and non-coding common and all segments of RNAs encoding proteins associated with one codons and all segments of RNAs encoding proteins associated with one coding common and conditions or mixtures. The antisense oligonucleotides conditions or mixtures. The antisense oligonucleotides conditions or mixtures and conditions. Typical diseases and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions. Typical diseases and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions are those associated with impaired respiration and conditions. Cystic fibrosis, confilmmention, including lung diseases, pulmonary vasoconstriction, emphysema, chronic cobstructive pulmonary disease (OPPD), and cancers such as leukemias, cymphomas, carcinomas e.g. colon cancer, breast cancer, melanoma, concer, hepatocellular carcinoma, kidney cancer, melanoma, concer, hepatocellular carcinoma, kidney cancer, melanoma, concer, melanoma, metastasize concer and prostate cancer.

                                                                                                                                                                      γQ
                                                                                                                                                                                                                                                                                     AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) cantivity, and can be used in gene therapy and vaccine production, (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent.

C diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic antigen genomic to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK4942 to AAK6450 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                Query Match

                                                                                The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigent epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polypucleotides and the antigen-presenting cells are useful for stimulating and/or expanding realls specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polypucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The present sequence is a prostate specific polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                         New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer \cdot
